Replication Competency Testing

Source: permission of University of Kentucky

Most viral vectors used today are disabled such that replication competent viruses are not readily formed by any biological process that might occur in normal hosts. The **Depent** of Biosafety encourages the use of such vectors in all relevant applications. In particularly sensitive applications, demonstrating that the viral stock used has no apparent contamination with replication competent vectors is essential. Of course, assays for replication competence will never b perfect or absolute, so the Institutional Biosafety Committee (IBC) asks that one use a current procedure of demonstrated sensitivity and specificity. Below is a summary guide of the current IBC recommen**fdations**mon classes of vectors. If another procedure or reference method is used to accomplish the same conclusion, researchers a asked to submithat procedure and published article with their **IBQ** istration.

In general, the IBC will require use of such an assay whenever viruses **onfeictes**d cells are used in whole animals. Even more rigorous testing may be required in some instances, such as a vector bearing a pathogenic gene or in huma gene therapy, oin any materials that could be released in the environment. Viral testing is not generally required if experiments are conducted entirely in tissue culture.

| Virus | Method | Reference |
|---|--|--|
| | | |
| | | <u>rus-contaminating recombinant adenovirus</u> stocks. J Virol Methods 56:99-107. |
| Adeno-associated virus (with ade- novirus hel he9 (us)-05tipe99be a 2. | Test for RCV by PCR prior to use. Confirmation - searcher prior to use in animals. | Hehir KM, Armentano D, Cardoza LM, et al. <u>1996. Molecular characterization of replica-</u> <u>tion-competent variants of adenovirus vec-</u> <u>tors and genome modifications to prevent</u> <u>their occurrence. J Virol 70:8459-8467.</u> |
| Adeno-associated virus (Adenovirus-free) | Testing not required. | |
| Lentivirus | Test for RCV by ELISA assay for p24 antigen. Confirmation of absence of RCV must be docu- mented by researcher prior to use in animals. | Dull T, Zufferey R, Kelly M, Mandel RJ, Nguyen M, Trono D, Naldini L. 1998 A third- generation lentivirus vector with a condi- tional packaging system. J Virol 72:8463- 8471. |
| Retrovirus (ecotrophic and am- photrophic) | Test for RCV by amplification in a permissive cell line followed by screening by appropriate detec- tion assay. Confirmation of absence of RCV must be documented by researcher prior to use in animals. | Wilson, C.A., Ng, T. H., and Miller, A. E., <u>1997. Evaluation of recommendations for</u> <u>replication-competent retrovirus testing as-</u> <u>sociated with use of retroviral vectors. Hu-</u> <u>man Gene Therapy, 8(7): 869-874.</u> |
